

### **ABSTRACT**

A modular reflective and light emitting illumination device that includes a first side made of a reflective material having holes therein, and a plurality of fiber optic cables secured to a single light emitting diode (LED) within the illumination device to emit light through the holes. A second side of the illumination device includes an attaching surface, such as a magnetic or Velcro® layer, for securing the illumination device to articles, such as clothes, automobiles, poles, etc. The illumination device further includes a male and female connector on opposite ends of the device, so that multiple illumination devices may be interconnected to one another. This allows multiple illumination devices to be assembled into various shapes and sizes to suit a user's particular purpose.
